Abstract: This paper represents a checklist of rust fungi of Genus *Uromyces* (Link) Unger in Pakistan together with their known host plants. A total of sixty four (64) are mentioned here. This number may include two (02) indigenous species of rusts. Several specimens have been found rare, being known from a limited number of collections. Species identification, distribution and host index have been provided.

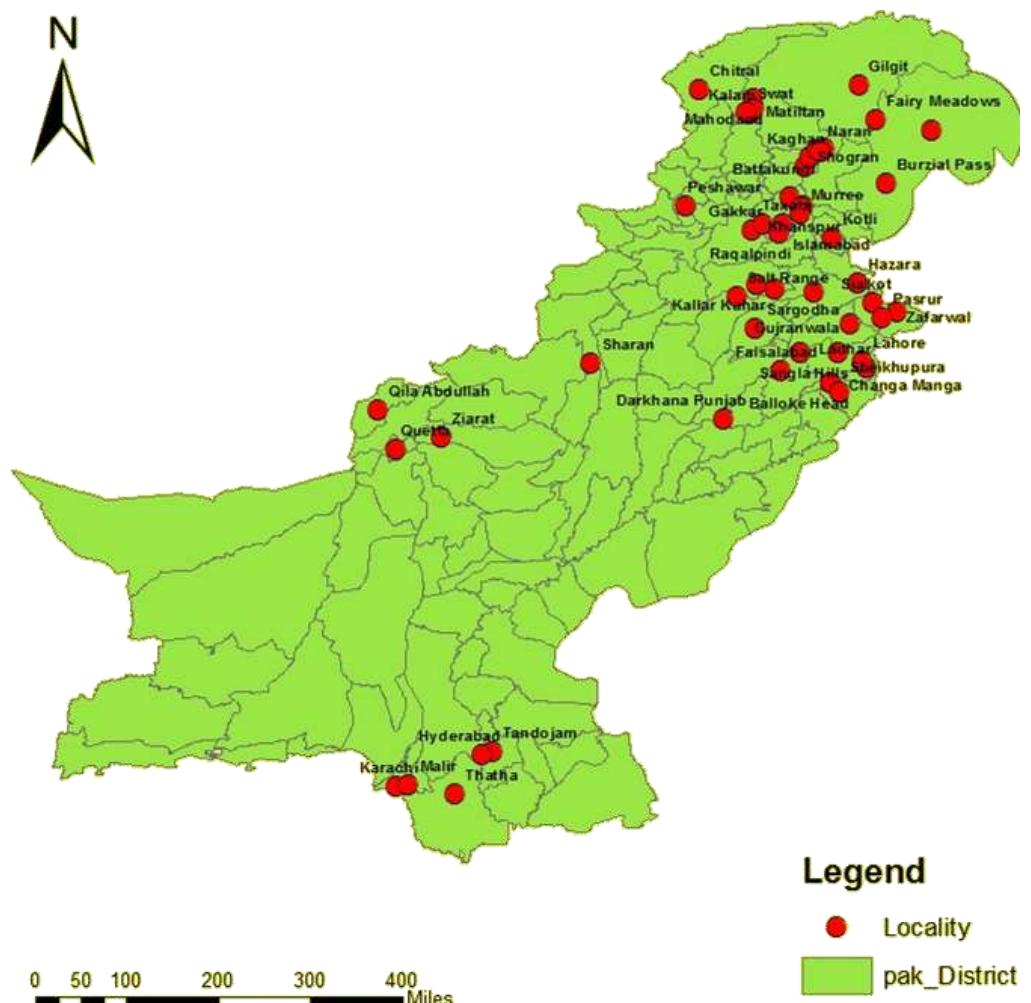

Key Words: Biodiversity, leguminous rust, Biocontrol, Host specificity

1. Introduction

Uromyces (Link) Unger, the second largest genus of Uredinales (Rust fungi) next to *Puccinia* Pers., parasitizes economically important plants throughout the world. This genus contains about 600 species distributed worldwide, among which sixty four (64) species have been reported in Pakistan till 2013, parasitizing sixteen (16) plant families. Fabaceae has been found having most potential hosts for this genus in Pakistan as thirty (30) species have been recorded on members of this family. Fourteen (14) species on Poaceous hosts, four (04) on Polygonaceae and Euphorbiaceae each, three (03) on Chenopodiaceae and one (01) species of *Uromyces* on Acanthaceae, Boraginaceae, Caryophyllaceae, Cyperaceae, Liliaceae, Geraniaceae, Plumbaginaceae, Ranunculaceae and Valerianaceae each, have been recorded while one (01) species is found having wide host range being a parasite of both Euphorbiaceae and Papilionaceae. Occurrence of maximum number of *Uromyces* species on fabaceous from Pakistan is in line with data from other countries. This manuscript is a compilation of available species of *Uromyces* reported from, or know to occur, in Pakistan. Species identification, distribution and host index have been provided. This data will help in further studies related to diversity of this genus and its usage as biocontrol agents against noxious poaceous weeds.

2. Material and Method

The checklist is based on published literature and study of herbarium specimens (LAH Herbarium). The current names of fungi are given according to www.indexfungorum.org and nomenclature of host plants are given according to www.ipni.org.

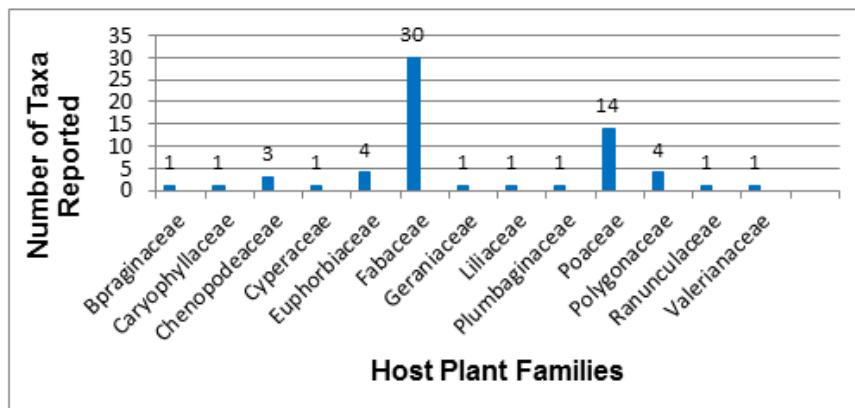

Fig. 2: Graph showing diversity of *Uromyces* on different host plant families

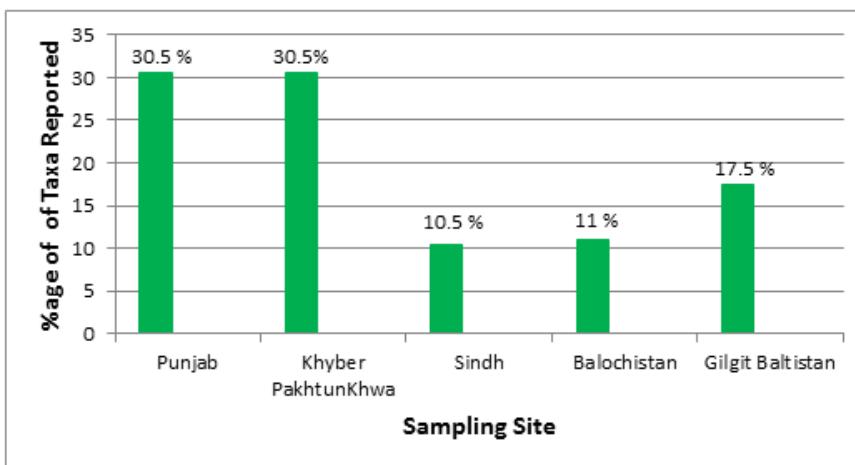

Fig. 3: Graph showing diversity of *Uromyces* in provinces of Pakistan.

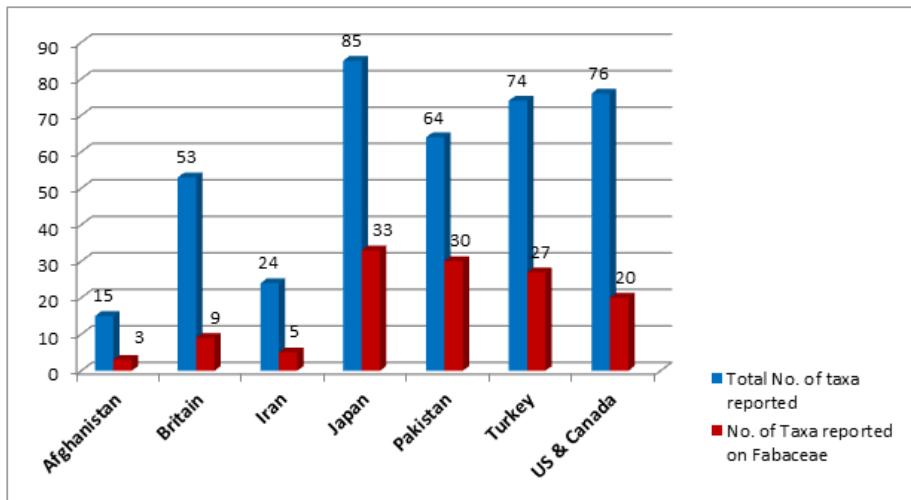

Fig. 4: Graph showing comparative data of host plant families of *Uromyces* in world.

3. Conclusion

The *Uromyces* genus is poorly known throughout Pakistan as compared to rest of the world, which is clearly demonstrated by the above described data. An accurate picture of the diversity and distribution of *Uromyces* throughout the region awaits further surveys.
